CEL

Abstract

For our CEL project we worked with the City of London Water Engineering Division to assess claims and conceptions residents had about their tap water. We surveyed residents to allow them to express their thoughts and then used literature to assess their validity. Lastly, we wrote a report to give to the City of London about our findings.

How enjoyable was using an integrated approach?

Using an integrated approach our group was able to assess the claims made by residents from many different perspectives. We were also able to divide the tasks based on each of our strengths and disciplines so that each subtopic we had in our report had the most knowledgeable person working on it.

Were there any difficulties integrating sciences?

N/A

Any advice for future students?

If issues start to arise within your group make sure you address them early! Don't let them fester until near the end of the semester. Make sure you have regular group meetings and keep open communication within your group.
